1. Problem Statement:

The Global Superstore dataset contains a large volume of sales transactions related to customers, products, profits and geographical regions, making manual analysis difficult. There is a need to generate relational and multidimensional reports using Power BI to analyse individual transactions, geographical performance and business trends. The objective is to create comparative charts and an interactive dashboard using Table and Matrix visuals, KPI cards and slicers to identify business insights and support effective decision-making.

2. Solution

- Verified the star schema and relationships between Fact_Sales and dimension tables.
- Created a geographical hierarchy (Geo_Hierarchy) using Region, State and City.
- Developed a relational report using a Table visual with sorting and profit filtering.
- Created a multidimensional Matrix report with Sales, Profit and Quantity.
- Performed geographical drill-down and drill-up operations.
- Developed comparative charts for Sales by Category, Profit by Region, Top 10 Customers and Yearly Sales Trends.
- Created KPI cards displaying Total Sales, Total Profit and Total Orders.
- Added Region, Category and Year slicers for interactive filtering.
- Tested dashboard interactions to ensure all visuals updated dynamically.

Sum of Sales
12.64M

Total Profit
1.47M

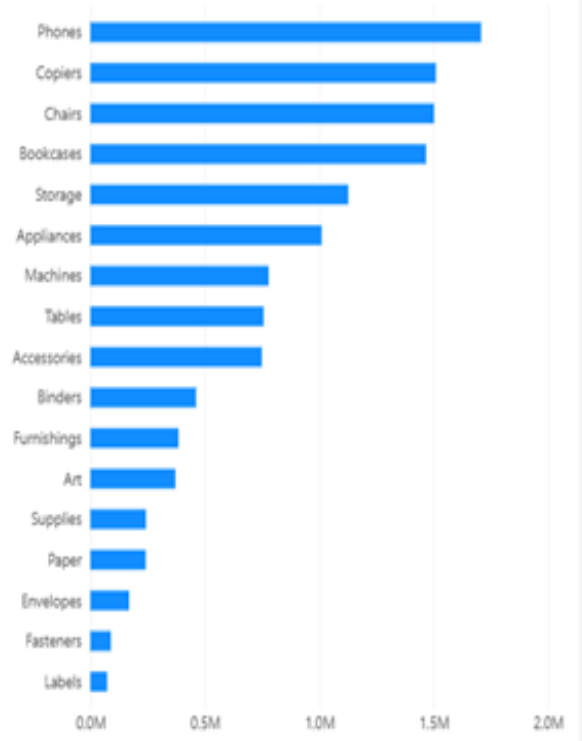

Total Orders
26K
