1. Problem Statement

Global Superstore is experiencing an increase in sales, but its profitability is not growing at the expected rate. Management needs a detailed analysis of business performance to identify factors affecting profitability, evaluate regional sales, product category performance, customer segments and sales trends. Therefore, advanced analytics techniques using Power BI are required to identify business strengths, weaknesses and growth opportunities and provide strategic recommendations through analytical reports and executive presentations for effective decision-making.

2. Solution

- Opened and reviewed the existing Power BI reports and Executive Dashboard created in Experiment 6.
- Created a Regional Analysis report to evaluate sales performance across different regions.
- Developed a Profitability by Product Category chart to compare category-wise profits.
- Analysed customer segment performance using Sales and Profit charts.
- Created monthly and yearly sales trend visualizations to identify peak sales periods.
- Identified business strengths based on high-performing regions, profitable categories and customer segments.
- Identified business weaknesses by examining low-profit and loss-making categories and regions.
- Analysed potential business opportunities to improve sales and profitability.
- Evaluated KPI cards and the Business Performance Scorecard to support analytical findings.
- Prepared business recommendations based on the analysis.
- Presented the findings through a final analytical report and executive presentation.
