1. Problem Statement

Global Superstore requires a reliable reporting system to deliver business reports to stakeholders on time and monitor important performance indicators. Manual report preparation and distribution can cause delays in identifying changes in sales, profitability and product returns. Therefore, there is a need to design a report scheduling plan, distribution matrix and KPI alert mechanism using Power BI to monitor business performance, identify potential issues and recommend corrective actions.

2. Solution

- Created a Scheduling_Plan table to define report frequency, intended users and delivery times.
- Developed a Distribution_Matrix to specify report recipients, frequency and delivery methods.
- Created a KPI_Alert_Config table to define alert conditions, responsible persons and recommended actions.
- Developed DAX measures for Total Sales, Total Profit, Profit Margin and Total Orders.
- Created a Profit Margin KPI Card with percentage formatting.
- Developed a Profit Margin Alert measure to identify profitability below 10%.
- Created a Regional Profitability chart to compare profit across different regions.
- Developed a Monitoring_Analysis table to identify business problems, alert triggers and corrective actions.
- Designed an automated reporting and monitoring strategy for timely business performance tracking
